

Server Virtualization

Today I am configuring a Hyper-V Virtual Server that will be used as a Terminal Server for 20 users in the field. I find that this solution is saving my client time, money, and is helping to have them become more energy efficient.

Computers are great and it is hard to imagine a world with out them, but most of the time that our computers are running, they are not being used! With Virtualization techniques we can consolidate to more energy efficient computers, while reducing the need for older computers to continually be left on.
