Balancing the Designed and the Natural Worlds

MISSION:

To encourage environmentally sound engineering, business and development practices.

Through scientific study, education, research and community outreach, the Corporation seeks to set a standard of practice in the community, by encouraging and facilitating change locally and regionally that will ultimately raise the standard for every community on a national level.

Our goals include working toward sustainable growth and reducing energy consumption, water use and waste production. We seek to guide responsible development of our natural resources, with the understanding that we too are a part of nature. Development and environmental stewardship can occur together, the ideas are not mutually exclusive.

Here at Engineering for the Earth, Inc., we bring together dedicated scientists and engineers from all disciplines to face the challenges head on.
